

February Monthly Math Challenge Middle School Level

Instructions:

TEAMS coaches submit student answers to the question(s) below using the submission link on the TEAMS website. All submissions must be made during the month of February. Those submissions with correct answers will be entered into a drawing for a \$25 Visa gift card, which will be sent to the student in care of the TEAMS coach.

Normal Distribution:

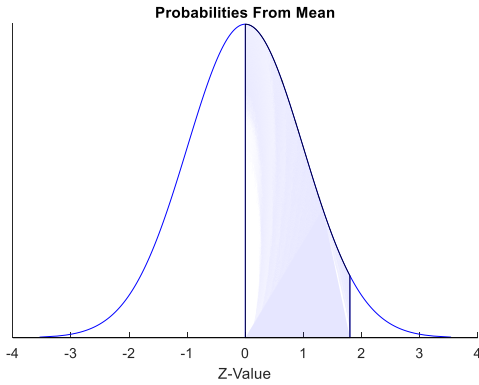

Engineering relies on the analysis of data, and data often presents itself as a normal distribution. Examples of normally distributed data include exam scores for many students, height of many people, time to run a mile for a large population of people, and manufacturing information.

The normal distribution has a characteristic look, also known as a bell curve. The normal distribution is symmetrical about the mean of the data, and if we know the mean and standard deviation of the data, we know that the area between the mean and +/- one standard deviations equals 68%; the area between the mean and +/- two standard deviations is 95%; between the mean and +/- three standard deviations is 99%, etc. Since the curve is symmetrical, 34% of data between the mean and +1 SD, and 34% of the data fall between the mean and -1 SD.

Probabilities dealing with full values of standard deviations are often memorized. To find the area beneath the curve between values that are not at exact standard deviation values, a table of “Z scores” is usually used. The relationship of probability, Z-score, SD, and the value in question is shown in the equation below.

The relationship between the Z-score and probability is shown in the Z-table below.

$$Z = \frac{x - \bar{x}}{SD}$$

Note: this value tells us that 46.41% of the data would fall between the mean value and a z value of 1.80, (as shown in the figure)

Z-Scores Probabilities

Please answer the following questions below:

A manufacturer has developed an edible spoon as an alternative to plastic spoons. They have measured the mass of material used per spoon and found that the mean is 10.0 grams with a standard deviation of 0.8 grams.

Question 1:

If we took a sample of 1000 spoons, how many spoons would have a mass between 9.2 and 10.8 grams?

Question 2:

With this same sample of 1000 spoons, how many spoons would we expect to have a mass between 10.0 grams and 11.0 grams?
