

## January Monthly Math Challenge High School Level

### Instructions:

TEAMS coaches submit student answers to the question(s) below using the submission link on the TEAMS website. All submissions must be made during the month of January. Those submissions with correct answers will be entered into a drawing for a \$25 Visa gift card, which will be sent to the student in care of the TEAMS coach.

### Normal Distribution:

Engineering relies on the analysis of data, and data often presents itself as a normal distribution. Examples of normally distributed data includes exam scores for many students, heights of many people, time to run a mile for a large population of people, and manufacturing information.

The normal distribution has a characteristic look, also known as a bell curve. The normal distribution is symmetrical, centered about its mean. If we know the mean and standard deviation of the data, we know that the area between the mean and  $\pm$  one standard deviation equals 68%; the area between the mean and  $\pm$  two standard deviations is 95%; the area between the mean and  $\pm$  three standard deviations is 99%, etc. Since the curve is symmetrical, 34% of data falls between the mean and +1 SD, and 34% of the data falls between the mean and -1 SD.

Probabilities dealing with full values of standard deviations are often memorized. To find the area beneath the curve between values that are not at exact standard deviation values, the integral of the equation of the normal curve must be determined – or we can use a table of “Z scores”. The relationship of probability, Z-score, SD, and the value in question is shown in the equation below; the relationship between the Z-score and probability is shown in the Z-table, below.

$$Z = \frac{x - \bar{x}}{SD}$$

**Z-Scores Probabilities**

**Use the following information and the Z-Table to answer the questions below:**

A manufacturer is making widgets, and measuring thousands has shown that the width is normally distributed. The mean is 100 mm and the standard deviation is 15 mm.

**Question 1:**

What is the probability that any widget is wider than 120 mm?

**Question 2:**

What is the probability that the width is less than 95 mm?
